DBMS iTC status 31 August 2026

Executive Summary

- Version 2.0 completed public review, was published to the ITC website, and is now the authoritative version for evaluations.
- The Database as a Service module is approximately 70–75% complete and is being refined to make testing more pragmatic and vendor-neutral.
- The group discussed approaching NIAP about reviewing and potentially listing the DBMS collaborative Protection Profile, including its crypto, cloud, and Database as a Service configurations.
- The group reviewed requirements-explorer demonstrations, automated issue tracking, ITC role confirmations, and the status of related evaluations and protection profiles.
- Josh supported making the NIAP outreach an ITC request rather than an Oracle request and offered to participate in the discussion.
- Brandon and Maureen’s availability is constrained by ICCC presentations and preparation, an AI-for-Common-Criteria discussion, and a planned EU CRA talk.
- Brandon, Maureen, and Josh are expected to be at ICCC at the end of September; the next regular call is planned for the end of October.

Topics Discussed

Version 2.0 and modules

- The public review period for version 2.0 has ended; website updates and notification to the CC portals were completed, with synchronization expected soon.
- The Database as a Service draft is available in the GitHub repository for review, alongside a high-level “reader’s digest” view.
- The testing methodology was loosened to avoid requiring exhaustive testing of every endpoint and data-transfer path while retaining useful assurance.
- The module is being refined for clarity, consistency, and reduced duplication where appropriate.

Crypto and NIAP engagement

- The crypto configurations discussed were base plus crypto, base plus crypto plus cloud, and base plus crypto plus Database as a Service.

- The crypto module largely mirrors NIAP's crypto catalog; additional higher-level requirements address key management, trusted-channel key import, and KMIP interoperability.
- The group considered asking NIAP what would be needed for the DBMS CPP to be reviewed and listed as approved.
- Converting the ASCII document to NIAP's XML schema was discussed as a possible fallback if NIAP lacks resources to review the material; it was described as substantial work.

Requirements Explorer and follow-up work

- A presentation or live demonstration of the Requirements Explorer for CCF/CCUF was discussed.
- Automated issue tracking remains a possible enhancement to the tool.
- Formal comments are to be solicited for the cloud, crypto, and Database as a Service materials, with some additional ITC work deferred around ICCC preparation.

ITC administration and evaluation status

- Gaia and Anders confirmed that they were willing to continue as co-chair and technical editor, respectively; the key-person list will be updated.
- The Crunchy Data evaluation was updated with the CPP reference; the discussion indicated that two evaluations now have that reference.
- The older DBMS protection profile was described as effectively obsolete and expected to expire under the transition to CC 2022; a 2027 date was mentioned as a recollection, not confirmed.

General Observations

- The call included informal conversation about weather, microphones, conference participation, and NIAP organizational changes.
- A Zoom AI recording/recap workflow was discussed as a way to reduce manual meeting-minute preparation.

Decisions

- **Decision:** Treat published version 2.0 as the authoritative version for evaluations.
- **Decision:** Continue Gaya as co-chair and Anders as technical editor, following their confirmations.
- **Decision:** Cancel the next regular call around the end-of-September ICCC period and reconvene at the end of October.

Action Items

- Prepare and deliver a CCF/CCUF presentation or live demonstration of the Requirements Explorer
- Continue considering or implementing automated issue tracking for the Requirements Explorer
- Solicit formal comments on the cloud, crypto, and Database as a Service materials
- Update the ITC key-person list with the confirmed roles
- Send a notice when the CC portal has been updated with the new CC 2022 information
- Maureen to prepare the ITC update and route its content for review

Risks / Open Questions

- Will NIAP assign resources to review the DBMS CPP and consider listing it as approved?
- What specific objections or review requirements might NIAP raise regarding the DBMS CPP and its crypto configurations?
- Whether conversion to NIAP's XML schema will be necessary remains dependent on NIAP's review capacity.
- The exact expiration date for non-CC-2022-compliant protection profiles was not confirmed; 2027 was mentioned tentatively.
