Meeting assets for DBMS iTC status call - 2026 are ready!

Meeting summary

Quick recap

The meeting focused on reviewing updates to the CC 2022 protection profile and discussing new tools for evaluating cloud and database modules. Brandon demonstrated significant improvements to the website presentation of their work, including a new Requirements Explorer tool that makes it easier for reviewers to understand protection profiles and trace requirements. The team discussed the status of public reviews for the cloud and crypto modules, with the CC 2022 update nearing completion and ready for finalization. They also reviewed the database as a service module, which includes new threat models for evaluating both the database management system and the control plane. The group noted that Crunchy Data recently received CC certification for their database product through the Canadian scheme.

Next steps

Brandon

- Finalize and post the CC 2022 update after the public comment period closes.
- Prepare a presentation for CCUF to demonstrate the new Requirements Explorer and Reader's Guide tools.
- Consider adding automated issue tracking to the Requirements Explorer tool.
- Plan to solicit formal public comment for the cloud, crypto, and database as a service modules after finalizing CC 2022.

Maureen

- Review the CC 2022 update draft before the public comment period closes on the 10th.
- Update the key person list for the ITC, confirming roles with Anders and Gaya.
- Follow up with Conan to ensure the CPP reference is listed for the Oracle database product on the CC Portal.

Collaboration

- All: Schedule the next ITC meeting for a date in late August or early September, avoiding the week of August 27th.

Summary

Website and Documentation Updates

Maureen and Brandon discussed updates to their website, with Brandon explaining that Codex applied new CSS styling to bring the site's appearance in line with other ITC websites. Brandon also mentioned that version 2.0 of their documentation is under public review while the cloud and crypto modules have been updated based on feedback from Anders. The discussion revealed that the website improvements made the documentation easier to read by better illustrating actual changes rather than just showing table of content shifts.

Cloud Module Review Tool Demo

Brandon demonstrated a new interactive tool for reviewing cloud modules that includes a Requirements Explorer feature showing SFRs and their traces. Josh suggested presenting this tool at the upcoming CCUF meeting, which Brandon agreed would be a good opportunity to showcase the functionality. The tool is accessible through GitHub and provides a more user-friendly way for people to review documents compared to traditional flat documents.

Visual System Relationship Tool Demo

Brandon demonstrated a visual tool he created to help understand and trace relationships in their system, which Sean praised as potentially making their work more efficient. The tool can display different configurations including database as a service and cloud configurations, with the database module showing more complexity due to its control plane components. Brandon noted he's working on balancing useful guidance with test case coverage in the supporting documentation.

Document Evaluation Process Modernization

The team discussed challenges with the current document-based evaluation process, particularly regarding the HTML and PDF formats. Josh questioned why the process still relies on paper-like documents when more modern approaches could be used. The group considered proposing

questions about updating outdated systems at an upcoming ICCC meeting, and discussed potential improvements such as using tools for matching security targets and protection profiles.

AI Evaluation Tool Demonstration

Brandon demonstrated a new AI-powered evaluation tool that compares test artifacts and automatically annotates packet captures, noting that previous attempts six to eight months ago produced poor results but recent improvements in ChatGPT's 5.6 model made it more useful. Josh suggested showing the tool to Tyrone and potentially presenting it at an upcoming team call, while Maureen and Sean discussed how their companies are already working on similar technologies. The group agreed to continue the discussion on the CCUF Slack channel and potentially add it to Monday's agenda.

CCUF Event Planning Discussion

The team discussed the upcoming CCUF event and its agenda, noting that the Monday workshop run by CNXT is Europe-based and focused on high-assurance topics, while the CCUF will cover different areas like automation and cloud computing. They confirmed the public comment period for the CC 2022 update closes on the 10th, with Anders having already provided thorough comments and the team planning to review any remaining changes. The group acknowledged they are the last ITG to meet this deadline and noted they will need to focus energy on the crypto module in the future.

Cryptographic Modules Status Update

The team discussed the status of several cryptographic modules and standards. Brandon reported adding PQC algorithms and creating two use cases for the crypto catalog - one allowing all CCDB approved crypto selections and another for Enterprise Enhanced with NIAP 2.0 only selections. The team confirmed that the CC 2022 document is out for public review and the crypto, cloud, and database as a service modules are ready for ITC review and are publicly available. Maureen noted that Crunchy Data has received CC certification for their database through the Canadian scheme, and the team discussed upcoming presentations at ICCC where Brandon will present on the database as a service module and Maureen will present the database ITC update.
